Do: your MVP (important + urgent)

- Add friends' names to the group
- Log an expense: description, who paid, amount, and who was included
- Split each expense equally among the people included
- Show each person's running balance (owed vs. owes)
- Show settle-up payments ("Sam pays Alex $12.50")
- Save expenses to a CSV file and load them on startup
- Simple text menu to choose actions

Schedule: V2.0+ (important, not urgent)

- Custom splits (exact amounts or percentages per person)
- Record a payback ("Sam paid Alex $12.50") to clear balances
- Edit or delete a logged expense
- Multiple separate groups (roommates vs. spring break trip)

Delegate: use a library or built-in tool (not important, urgent)

- Reading/writing the CSV file → Java's built-in `BufferedReader` / `FileWriter`
- Formatting money as `$12.50` → `java.text.NumberFormat`
- Recording expense dates → `java.time.LocalDate`
- Testing that splits add up correctly → JUnit

Delete: cut it (not important, not urgent)

- Graphical or mobile app interface
- User accounts with logins and passwords
- Sending real payments through Venmo/PayPal
- Email or text reminders to people who owe money
